

Rhino[®] XD2H Heated Control Modules

Description

NOTE: Throughout this document the Rhino XD2H Heated Control Modules are referred to as the Control Module.

See Figure 1. The Control Module (2) provides the pneumatic operating functions for Rhino heated XD2H bulk unloaders (1). See Figure 2 and refer to Table 1 for a list of the Control Module components.

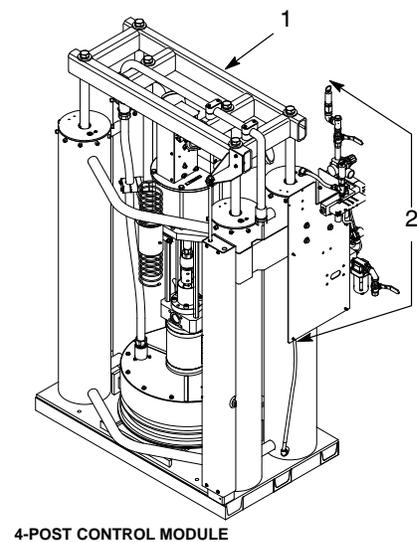

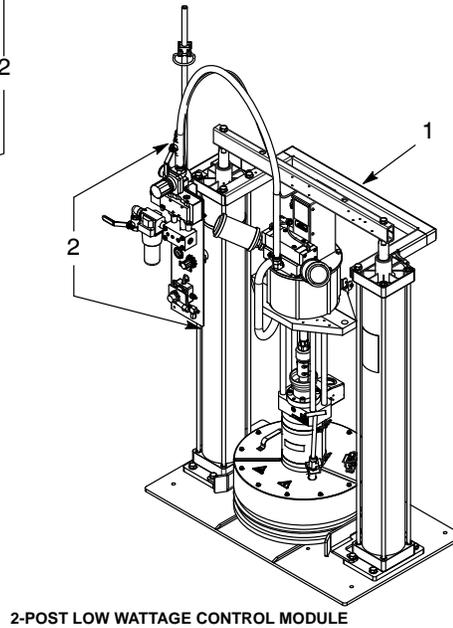

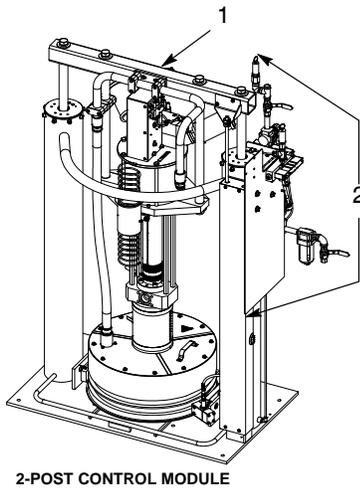

Figure 1 Rhino Heated XD2H Control Modules

NOTE: The two-post low wattage control module does not use all of these components.

Table 1 Control Module Component Descriptions

Item	Description
1	Master Air Lockout Ball Valve: When this valve is in the Open position, it supplies air to the bulk unloader pneumatic circuit. Closing the valve disables the bulk unloader and vents the supply air to the control valves.
2	Filter/Separator: Five-micron filter that removes most contaminants and moisture from the supply air.
3	Ram Up/Down Regulator: Sets the amount of air pressure going to the ram cylinders which determines the amount of pressure the follower plate exerts on the material.
4	Ram Down Speed Adjuster: An exhaust flow-control muffler controls ram speed in the Down direction. Turning the adjustment screw clockwise decreases ram speed movement. Turning the adjustment screw counterclockwise increases ram speed movement. NOTE: The ram speed is not adjustable on the 4-post control module because it is configured with a nonadjustable muffler.
5	Air Motor Control Valve: Receives signals from the system controller to control the air motor..
6	Air Motor Regulator: Sets the amount of air pressure to the air motor and determines the amount of material pressure exiting the bulk unloader.
7	Air Motor Lockout Valve: When this valve is in the Close position it locks out and vents air pressure to the air motor. It also prevents the pump from stroking but it does not shut off the ram air supply. The ram air supply is required to raise and lower the ram when the air motor is deactivated.
8	Air Motor Relief Valve: A safety feature that limits the operating air pressure to the air motor. It limits the potential output pressure of the bulk unloader pump. The pressure value is system-dependent and is selected based on overall systems parameters.
9	Ram Control Relief Valve: A safety feature that limits the operating air pressure to the ram cylinders. It limits the potential output pressure of the ram cylinders and is set at 109 psi (7.5 bar).
10	Ram Up/Down Control Valve: Receives signals from the system controller to control ram movement: <ul style="list-style-type: none"> • Ram Up raises the ram and follower plate assembly. • Neutral halts ram movement and pneumatically locks the rams. • Ram Down lowers the ram and follower plate assembly. NOTE: The Neutral position does not lock the ram. Air pressure remains in the ram cylinders. Small air leaks in the circuit can cause the ram to drift upward or downward. Never leave the bulk unloader in the Neutral position to perform maintenance, or when it is not in use for long periods of time. When performing maintenance, make sure that the ram and follower plate assembly is on the bulk unloader base or secured using support blocks.
11	Ram Up Speed Adjuster: An exhaust flow-control muffler controls ram speed in the Up direction. Turning the adjustment screw clockwise decreases ram speed movement. Turning the adjustment screw counterclockwise increases ram speed movement. NOTE: The ram speed is not adjustable on the 4-post control module because it is configured with a nonadjustable muffler.

Installation

WARNING: Allow only qualified personnel to perform the following tasks. Follow the safety instructions in this document and all other related documentation.

NOTE: Read and understand the *Safety* section in the Nordson *System Documentation* that shipped with the system before installing the Control Module.

1. See Figure 3. Mount the Control Module (3) onto the bulk unloader using the supplied screws (4) and washers (5). Tighten the screws securely.
2. Connect the Ram Down tubing (6) to the upper cylinder fitting (7).
3. Connect the Ram UP tubing (2) to the lower cylinder fitting (1).

Operation

Control Module operation is dependent on the system application. Refer to the Nordson *System Documentation* that shipped with the system for specific application parameters and operating procedures.
